core concepts with practical examples

1 Derivatives and Rates of Change Imagine you're tracking the position of a car over time The derivative of its position function represents its velocity rate of change of position If the position function is  $s(t) = t^2$  then the velocity function is  $v(t) = 2t$  At time  $t = 3$  seconds the car's velocity is 6 units/second Visual A graph depicting a parabola representing the position function and its tangent line at  $t = 3$  showing the instantaneous velocity

2 Integrals and Accumulation Suppose you're calculating the area under a curve The definite integral provides the solution If you're finding the area under the curve  $f(x) = x^2$  from  $x = 0$  to  $x = 2$  the integral would be calculated as  $\int_0^2 x^2 dx = \frac{1}{3}x^3 \Big|_0^2 = \frac{8}{3}$  square units Visual A graph showing the area under the curve of  $f(x) = x^2$  from  $x = 0$  to  $x = 2$  shaded to highlight the calculated area

3 Optimization Problems A classic calculus application involves finding maximum or minimum values For example you might want to maximize the area of a rectangular garden given a fixed perimeter Using calculus you can derive the dimensions that maximize the area Visual A diagram showing a rectangle with labeled sides and a short explanation of how calculus is used to maximize the area

Howto Section Tackling a Challenging Problem Lets tackle a problem involving related rates Problem A ladder 10 meters long rests against a vertical wall If the bottom of the ladder slides away from the wall at a rate of 1 m/s how fast is the top of the ladder sliding down the wall when the bottom of the ladder is 6 meters from the wall Solution Stepbystep solution using derivatives and the Pythagorean theorem would be included here explaining each step clearly and concisely This section would include a detailed stepbystep solution utilizing diagrams and formulas to illustrate the process
